## Mid－Term Exam II Electronics（III）NCKUEE

1．Consider an $\mathrm{N}^{\text {th }}$－order Butterworth low－pass filter $T(j \omega)$ whose passband edge $\omega_{\mathrm{p}}=200 \mathrm{krad} / \mathrm{s}$ ，stopband edge $\omega_{s}=2 \mathrm{Mrad} / \mathrm{s}$ ，maximum allowed variation in passband $\mathrm{A}_{\max }=2.7 \mathrm{~dB}$ ，minimun required stopband attenuation $\mathrm{A}_{\min }=60 \mathrm{~dB}$ ，and magnitude function $|T(j \omega)|=\frac{1}{\sqrt{1+\varepsilon^{2}\left(\frac{\omega}{\omega_{p}}\right)^{2 N}}}$ ．
（a）Please find how many poles and zeros does this filter have．
（b）Find $\varepsilon$ ．
（c）Find the minimum required order N of the filter．
（d）If $\omega_{\mathrm{s}}$ is changed to $20 \mathrm{Mrad} / \mathrm{s}$ ，please repeat（b）．
（e）If $\mathrm{N}=2$ and $\varepsilon=0.5$ ，Please re－calculate the maximum allowed variation in passband $\mathrm{A}_{\max }$ and the minimun required stopband attenuation $\mathrm{A}_{\text {min }}$ ．（Your answers should be expressed in dB ．）
（f）Please derive the normalized polynominal T （s）of a $2^{\text {nd }}$－order Butterworth filter with $\varepsilon=1$ ．

2．Fig． 2 shows an active－ RC integrator，and assume that $\mathrm{R}=10 \mathrm{k} \Omega, \mathrm{C}=10 \mathrm{pF}$ ．
（a）Assume that the op amp is ideal，please find the unity－gain bandwidth of the integrator．
（b）If the op amp has a finite DC gain $\mathrm{A}_{0}=80 \mathrm{~dB}$ and an infinite bandwidth，please find the dominant pole location of the integrator．
（c）If the op amp has a finite DC gain $\mathrm{A}_{0}$ and a -3 dB bandwidth $\omega_{\mathrm{p}}$ ， please explain the influence on the transfer function of the integrator．

3．Fig． 3 shows a switched－capacitor（SC）integrator and its two－phase clock $\Phi_{1}$ and $\Phi_{2}$ ．
（a）Explain why a SC－circuit can behave as a resistor？
（b）Derive the equivalent time constant for the SC integrator in
terms of $\mathrm{C}_{1}, \mathrm{C}_{2}$ and $\mathrm{T}_{\mathrm{c}}$ ．
（c）Compared with an active－RC integrator，please explain two benefits of a SC integrator for on－chip implementation．
（d）Explain how stray capacitances affect the circuit．
（e）Sketch two kinds of stray－insensitive switched－capacitor integrators（both inverting and non－inverting）and explain why it is stray－insensitive．

Fig． 2

Fig． 3

4．Fig． 4 shows a tuned amplifier，assuming that the transconductance and the output resistance of $M_{1}$ are $g_{m}$ and $r_{0}$ ，respectively．
（a）Sketch the small－signal equivalent circuit of the tuned amplifier．
（b）Assume that $\mathrm{R}=40 \mathrm{k} \Omega, \mathrm{L}=20 \mathrm{nH}, \mathrm{C}=20 \mathrm{pF}, \mathrm{g}_{\mathrm{m}}=4 \mathrm{~mA} / \mathrm{V}, \mathrm{r}_{\mathrm{o}}=40 \mathrm{k} \Omega$ ，please derive $\frac{v_{o}}{v_{i}}(s)$
（c）Find its ${ }^{i}$ center frequency $\omega_{0}$.

Fig． 4

5．Fig．5（a）and 5（b）show two 4－bit DACs，where $\mathrm{R}=\mathrm{R}_{\mathrm{F}}=5 \mathrm{k} \Omega, \mathrm{V}_{\mathrm{REF}}=1.8 \mathrm{~V}$ and $\mathrm{I}=1.5 \mathrm{~mA}$ ．
（a）Describe the operational principle of a 2－bit R－2R D／A converter．（Show figures if necessary）
（b）In Fig．5（a），please derive $\frac{\mathrm{V}_{o}}{V_{\text {ref }}}$ in terms of $\mathrm{B}_{0}, \mathrm{~B}_{1}, \mathrm{~B}_{2}, \mathrm{~B}_{3}, \mathrm{R}$ and $\mathrm{R}_{\mathrm{F}}$ ．
（c）In Fig．5（a），If bits $B_{0} B_{1} B_{2} B_{3}=(1010)_{2}$ ，please find the $V_{o}$ value．
（d）In Fig．5（b），if $B_{3}$ switches to $d$ ，and $B_{0} \sim B_{2}$ switch to ground，please find the $V_{o}$ value．
（e）In Fig．5（b），please derive $\frac{V_{o}}{I}$ in terms of $\mathrm{B}_{0}, \mathrm{~B}_{1}, \mathrm{~B}_{2}, \mathrm{~B}_{3}, \mathrm{R}$ and $\mathrm{R}_{\mathrm{F}}$ ．
（f）Please list pros and cons of the structure in Fig．5（a）compared with that in Fig．5（b）．

Fig．5（a）

Fig．5（b）

6．Fig． 6 shows a 5 －bit charge－redistribution ADC．
（a）Please determine and explain where the switches $\left(\mathrm{S}_{1}, \mathrm{~S}_{2}\right.$ and $\left.\mathrm{S}_{3}\right)$ should be connected when the ADC is in sample，hold，and charge－redistribution mode，respectively．
（b）Assume parasitic capacitance $\left(\mathrm{C}_{\mathrm{p}}\right)$ at node $\mathrm{V}_{\mathrm{X}}$ can be ignored．Please find the digital output $\left(\mathrm{b}_{1} \sim \mathrm{~b}_{5}\right)$ and intermediate node voltage $\left(\mathrm{V}_{\mathrm{X}}\right)$ when $\mathrm{V}_{\text {in }}=1.23 \mathrm{~V}$ and $\mathrm{V}_{\text {ref }}=5 \mathrm{~V}$ ．
（c）Assume parasitic capacitance $\left(C_{p}\right)$ at node $V_{X}$ is 8 C ．Please find the digital output（ $b_{1} \sim b_{5}$ ）and intermediate node voltage $\left(\mathrm{V}_{\mathrm{x}}\right)$ when $\mathrm{V}_{\text {in }}=1.23 \mathrm{~V}$ and $\mathrm{V}_{\text {ref }}=5 \mathrm{~V}$ ．
（d）If the ADC is redesigned and the specification that a $\mathrm{V}_{\text {LSB }}$ less than 0.01 V is required，how many number of bits are needed for the new ADC．

Fig． 6
7．Fig． 7 shows the pole－zero patterns of two filters．Both filters have one zero at the origin and the other zero at infinite．The distance from the origin to each pole is $\omega_{0}$ ，while $\boldsymbol{\theta}_{\boldsymbol{I}}>\boldsymbol{\theta}_{2}$ ．
（a）For Fig．7，please specify which type of filters it is and its order．
Explain your reason．（low－pass／high－pass／band－pass／band－reject／ all－pass）
（b）Compare both filters in Fig． 7 by roughly drawing their Bode magnitude plots．Explain your reason．（Mark $\omega_{0}$ in your plot．）

8．Fig． 8 is an active RC filter，assuming that the opamp has infinite input resistance，zero output resistance，and infinite bandwidth．Please answer the following questions．
（a）Please derive the transfer function $\frac{v_{\text {out }}}{v_{\text {in }}}(s)$ ．
（b）Assume that $\mathrm{R}_{1}=\mathrm{R}_{2}=100 \mathrm{k} \Omega, \mathrm{C}_{1}=10 \mathrm{pF}, \mathrm{C}_{2}=0.2 \mathrm{pF}$ ．When $\mathrm{v}_{\text {in }}=\mathrm{V}_{\mathrm{CM}}+\mathrm{V}_{\mathrm{in}} \times \sin (\omega \mathrm{t})$ ，where $\mathrm{V}_{\text {in }}=0.25 \mathrm{~V}$ and $\omega=10 \mathrm{Mrad} / \mathrm{s}$ ， please calculate the amplitude of $\mathrm{v}_{\text {out }}$ ．
（c）According to（b），if the opamp with limited slew rate $=15 \mathrm{~V} / \mathrm{us}$ ，

Fig． 8 please calculate the maximum operation frequency without slew rate limitation of this filter．

9．Please draw inverting and non－inverting type of stray insensitive SC integrators and explain why they are stray insensitive．

10．Fig． 10 shows a 3－bit flash ADC and its truth table of encoder．If $\mathrm{V}_{\mathrm{DD}}=12 \mathrm{~V}, \mathrm{~V}_{\mathrm{i}}=8 \mathrm{~V}$ ，please
（a）find $b_{1} b_{2} b_{3}$ ．
（b）calculate the number of comparators needed for a 6－bit flash ADC．
（c）explain the benefits and the drawbacks of the flash ADC compared with a 3－bit charge－redistribution ADC．

Fig． 10

11．Fig． 11 is a cascade ADC and its encoder table．The opearation process is that Vin1 is quantized by a first－stage ADC，then the encoder changes the thermalmeter code $T_{1 \sim 3}$ to the binary code $b_{1 \sim 2}$ ．The value of $\mathrm{V}_{\text {in } 2}$ is the difference between $\mathrm{V}_{\text {in } 1}$ and $\mathrm{V}_{\text {out }}$ ，and then is quantized by the second－stage $A D C$ to generate $\mathrm{b}_{3 \sim 5}$ ．
（a）Please answer what type the first－stage ADC is？
（b）Please answer what type the second－stage ADC is？
（c）If $\mathrm{V}_{\text {in } 1}=3 \mathrm{~V}$ ，please find the result of $\mathrm{T}_{1 \sim 3}$ and $\mathrm{b}_{1 \sim 2}$ ．
（d）If $\mathrm{V}_{\mathrm{in} 2}=1 \mathrm{~V}$ ，please find the result of $\mathrm{b}_{3 \sim 5}$ ．
（e）Please calcuate the resolution，in terms of bit number，of this cascade ADC．

Fig． 11

Encoder Table

12．Fig． 12 shows an active－ RC filter circuit，where $\mathrm{R}_{1}=100 \mathrm{k} \Omega, \mathrm{R}_{2}=1 \mathrm{M} \Omega$ and $\mathrm{C}=2 \mathrm{pF}$ ．
（a）Assume the op－amp is ideal，please derive the transfer function $T(s)=\frac{V_{o}}{V_{i}}$ in terms of $R_{1}, R_{2}$ and $C$ ．
（b）According to（a）， $\mathrm{V}_{\mathrm{i}}$ is a sine wave with a frequency of 10 Hz and a peak amplitude of 0.1 V ，please find the peak amplitude of $\mathrm{V}_{\mathrm{o}}$ ．
（c）Assume that the op－amp has a finite gain and a finite bandwidth， please derive $\mathrm{T}(\mathrm{s})$ and explain how the filter will be affected by these two non－idealities．
（d）Please calculate the pole of this filter．（unit： Hz ）
（e）To avoid affecting the passband of the filter，please specify the required unity－gain bandwidth of the opamp．Explain your reason．
（f）If a $0.5-\mathrm{V}_{\text {peak }}, 50 \mathrm{MHz}$ sine wave is inputted at $\mathrm{V}_{\mathrm{i}}$ ，please specify the

Fig． 12 required slew rate of the opamp．Explain your reason．

13．Figs．13（a）and 13（b）show a SC integrator and an active inductor circuit，respectively．
（a）In Fig．13（a），please derive the SC integrator＇s time constant in terms of $\mathrm{C}_{1}, \mathrm{C}_{2}$ and $\mathrm{T}_{\mathrm{C}}$ ．
（b）In Fig．13（a），explain why the circuit is insensitive to stray capacitances at node a，b and c．
（c）Please explain the pros and cons of a SC integrator compared with an active－RC one．
（d）In Fig．13（b），assume that all $\mathrm{G}_{\mathrm{m}}$ blocks have infinite input impedance，please derive the equivalent inductance $L_{e q}$ in terms of $C_{L}$ and $G_{m}$ ．

Fig．13（a）

Fig．13（b）

14．Please explain or give definitions of the following terms．
（a）Stagger－tuned amplifier
（i）Universal filter
（b）Synchronous－tuned amplifier
（j）Nyquist theorem
（c）Total harmonic distortion（THD）
（d）Antoniou inductance－simulation circuit
（e）Slew rate
（f）Inter－modulation distortion
（g）Full－power bandwidth
（h）Stray capacitor

15．Fig． 15 shows the block diagram of a universal filter，where $\frac{V_{x}(s)}{V_{i}(s)}=\frac{K s^{2}}{s^{2}+s\left(\omega_{0} / Q\right)+\omega_{0}{ }^{2}}$ ．
（a）Please specify which type of filter $\frac{V_{x}(s)}{V_{i}(s)}$ is．Explain your reason．
［Hint：low－pass／high－pass／band－pass／band－reject／all－pass］
（b）Please derive the transfer function $\frac{V_{z}(s)}{V_{i}(s)}$ ．Specify and explain which type of filter it is．

Fig． 15

16．Figs．16（a）and 16（b）show an inductor－simulation circuit and its equivalent model，respectively．
（a）Assume that the op amp is ideal，please express $\mathrm{V}_{\mathrm{x}}(\mathrm{s})$ in terms of $\mathrm{V}_{\mathrm{i}}(\mathrm{s}), \mathrm{R}_{2}$ ，and C ．
（b）Please prove that the equivalent inductance $\mathrm{L}_{\mathrm{eq}}=\mathrm{R}_{1} \mathrm{R}_{2} \mathrm{C}$ ，assume that $\mathrm{R}_{2} \gg \mathrm{R}_{1}$ and $\mathrm{sL}_{\text {eq }} \ll 1 /(\mathrm{sC})$ ．
［Hint：Fig．16（c）］．
（c）Compared with real on－chip inductor，please explain the pros and cons of the circuit in Fig．16（a）．

Fig．16（a）

Fig．16（b）

Fig．16（c）

17．Fig．17（a）shows an inductor－simulation circuit，and Fig．17（b）shows its equivalent model．Assume that the four transconductors is ideal，and ideal transconductors are defined in Fig．17（c）．
（a）In Fig．17（b），please express the current I in terms of $\mathrm{V}_{1}, \mathrm{~V}_{2}$ ，and the impedance $\mathrm{sL}_{\text {eq．}}$ ．
（b）Assume $\mathrm{g}_{\mathrm{m} 2}=\mathrm{g}_{\mathrm{m} 3}$ ，please prove that $\mathrm{I}_{1}=\mathrm{I}_{2}$ ．
（c）Assume $\mathrm{g}_{\mathrm{m} 1}=\mathrm{g}_{\mathrm{m} 2}=\mathrm{g}_{\mathrm{m} 3}=\mathrm{g}_{\mathrm{m} 4}=\mathrm{g}_{\mathrm{m}}$ ，please derive the equivalent inductance（ $\mathrm{L}_{\mathrm{eq}}$ ）in terms of $\mathrm{g}_{\mathrm{m}}$ and C ．
（d）Compared with a real inductor，please explain the benefits and drawbacks of the circuit in Fig．17（a）．

18．Fig． 18 shows the block diagram of a two－integrator－loop biquad．Please
（a）Express $\mathrm{V}_{\mathrm{t}}(\mathrm{s})$ in terms of $\mathrm{V}_{\mathrm{x}}(\mathrm{s}), \omega_{\mathrm{o}}$ and Q ．
（b）Derive the transfer function of $\frac{V_{x}(s)}{V_{i}(s)}$ ．
（c）Specify which types of filters $\frac{\mathrm{V}_{y}(\mathrm{~s})}{\mathrm{V}_{\mathrm{i}}(\mathrm{s})}$ and $\frac{\mathrm{V}_{\mathrm{z}}(\mathrm{s})}{\mathrm{V}_{\mathrm{i}}(\mathrm{s})}$ are．Explain your reason．

Fig． 18

19．Fig． 19 shows two implementation methods of noninverting integrator．
（a）Derive the transfer function of $\frac{\mathrm{V}_{\mathrm{ol}}(\mathrm{s})}{\mathrm{V}_{\mathrm{il}}(\mathrm{s})}$ in Fig．19（a）．
（b）In Fig．19（b），assume that $R_{2}$ is equivalent to a negative resistor，where $R_{2}=-R_{1}<0$ ．Please derive the transfer function of $\frac{\mathrm{V}_{\mathrm{oz}}(\mathrm{s})}{\mathrm{V}_{\mathrm{i} 2}(\mathrm{~s})}$ ．
（c）Draw the switched－capacitor version of the circuit in Fig．19（b）by replacing $R_{1}$ and $R_{2}$ with stray－insensitive switched－capacitor circuit．
（d）Compared with Fig．19（a），please list the benefits of switched－capacitor version in（c）．

Fig．19（a）

Fig．19（b）

20．（a）Please sketch both inverting and non－inverting stray－insensitive switched－capacitor（SC）integrator respectively．
（b）Fig． 20 shows an active－RC biquad，please sketch its SC equivalent circuit with only two op amps．
（c）Compared with active－RC filters，please list the benefits of SC filters．

Fig． 20
21．Fig． 21 shows a filter，where $\mathrm{R}=100 \mathrm{k} \Omega$ and $\mathrm{C}=1.6 \mathrm{pF}$ ．
（a）Assume that $\mathrm{V}_{\mathrm{i}}$ is a sine wave with a frequency of 100 kHz and a peak amplitude of 1 V ．If the op amp is ideal，please find the peak amplitude of $\mathrm{V}_{\mathrm{o}}$ ．
（b）If the op amp has a finite bandwidth and a finite slew rate，please

Fig． 21 explain how the filter＇s function will be influenced by the two non－idealities respectively．

22．Fig． 22 shows a 14－bit dual－slope ADC ．Assume $\mathrm{C}=100 \mathrm{pF}, \mathrm{V}_{\text {REF }}=-1.8 \mathrm{~V}$ ，and $\mathrm{v}_{\text {IN }}$ is in the range of 0 V and 1.8 V ．If the maximum conversion time T is 1 ms ，find the value of R and the required clock frequency $\mathrm{f}_{\text {clk．}}\left(\mathrm{f}_{\mathrm{clk}}=1 / \mathrm{T}_{\text {clk }}\right)$

Fig． 22

23．Draw a basic circuit of a 3－bit DAC utilizing an R－2R ladder network，and describe its operation．

24．（a）A charge－redistribution circuit is initially connected as in Fig．34a and then the circuit is connected as in Fig．

24b．Find the node voltage $V_{x}$ in Fig． $34 b$ where $V_{i n}=1 V$ and $V_{\text {ref }}=5 \mathrm{~V}$ ．
（b）Describe the operational principle of a 2－bit R－2R D／A converter．（Illustration is needed．）

Fig．24a

Fig．24b

25．（a）For a KHN circuit shown in Fig．25，please describe the functions of $\mathrm{V}_{\mathrm{a}}, \mathrm{V}_{\mathrm{b}}, \mathrm{V}_{\mathrm{c}}$ nodes and briefly explain the operational principle of the KHN circuit．
（b）Draw a Tow－Thomas circuit and explain its operational principle．

Fig． 25

26．As shown in Fig．26，a low－pass filter is specified to have passband edge $f_{p}=5 \mathrm{kHz}$ and a selectivity factor $\left(f_{s} / f_{p}\right)$ of 10 ．The specifications are met by a first－order transfer function $T(s)=\frac{2 \pi \times 10^{4}}{s+2 \pi \times 10^{4}}$ ．Please answer the following questions．
（a）Find the value of stopband edge $\left(f_{s}\right)$ ．
（b）Find the value of passband ripple $\left(\mathrm{A}_{\max }\right)$ ．
（c）Find the value of stopband attenuation $\left(\mathrm{A}_{\text {min }}\right)$ ．

27．Fig． 27 shows one of successive－approximation ADC＇s implementation operating in sample mode． Assume that $\mathrm{V}_{\mathrm{i}}=0.6 \mathrm{~V}, \mathrm{~V}_{\text {ref }}=1.0 \mathrm{~V}$ ．
（a）When entering the hold mode，$B_{0} \sim B_{2}$ and $S_{3}$ switch from $V_{i}$ to ground，and $S_{2}$ switches off， please find the value of $\mathrm{V}_{\mathrm{x}}$ ．
（b）According to（a），when entering the redistribution mode，only $B_{2}$ switches to $V_{\text {ref }}$ ，please find the value of $V_{x}$ ．
（c）Please give one benefit and one drawback of the successive－approximation ADC compared

Fig． 27
28．Fig． 28 shows an active－RC integrator．
（a）Assume that the opamp is ideal with $\mathrm{A}(\mathrm{s})=\infty$ ，please derive the transfer function $\frac{\mathrm{v}_{\mathrm{o}}}{\mathrm{V}_{\mathrm{i}}}(\mathrm{s})$ ．
（b）Assume that the opamp is real with $A(s)=\frac{A_{o}}{1+s / s_{1}}(s)$ ，pleases derive transfer function $\frac{\mathrm{V}_{\mathrm{o}}}{\mathrm{V}_{\mathrm{i}}}(\mathrm{s})$ ．

Fig． 28
（c）Please explain how the integrator will be affected by the finite gain and finite bandwidth of the real opamp，respectively．

29．Fig． 29 shows a binary－weighted 3－bit $D A C$ ，where $V_{\text {ref }}=0.5 \mathrm{~V}, \mathrm{R}_{\mathrm{F}}=2 \mathrm{k} \Omega$ and $\mathrm{R}=1 \mathrm{k} \Omega$ ．Please
（a）find $\mathrm{V}_{\text {out }}$ when the input binary bits $\mathrm{B}_{2} \mathrm{~B}_{1} \mathrm{~B}_{0}=(110)_{2}$ ．
（b）sketch an R－2R ladder－type 3－bit DAC．
（c）explain the benefit of the R－2R ladder－type compared with the binary－weighted DAC．

Fig． 29
